NoAr — Graphics maintenance refactor

Branch: claude/branch-review-opz967
Core implementation: 24af880c · 2026-11-07

- One Graphics domain: shared application controls, explicit data owners and engine specializations.
- Composer panels emit typed commands; a single document owns draft, history, saving and uploads.
- Unreachable legacy editors removed. Subtitles and controller examples retain their active flows.
- 714 Rust tests passed / 14 ignored; fmt, denied-warning Clippy and desktop-cpu all-target compilation passed.
- 33 clean-install browser tests plus one final API regression passed. Actual pt-BR desktop/phone interaction verified guides, dragging, save/reload, subtitles and read-only API examples.
- Seven architecture policy tests and the 188-file source boundary scan passed.
- 76 exact legacy responses and both XMLTV cases match 2.2.1. All 1,000 raw frames and 1,000 aligned HLS frames match in the static layout/transition fixture.

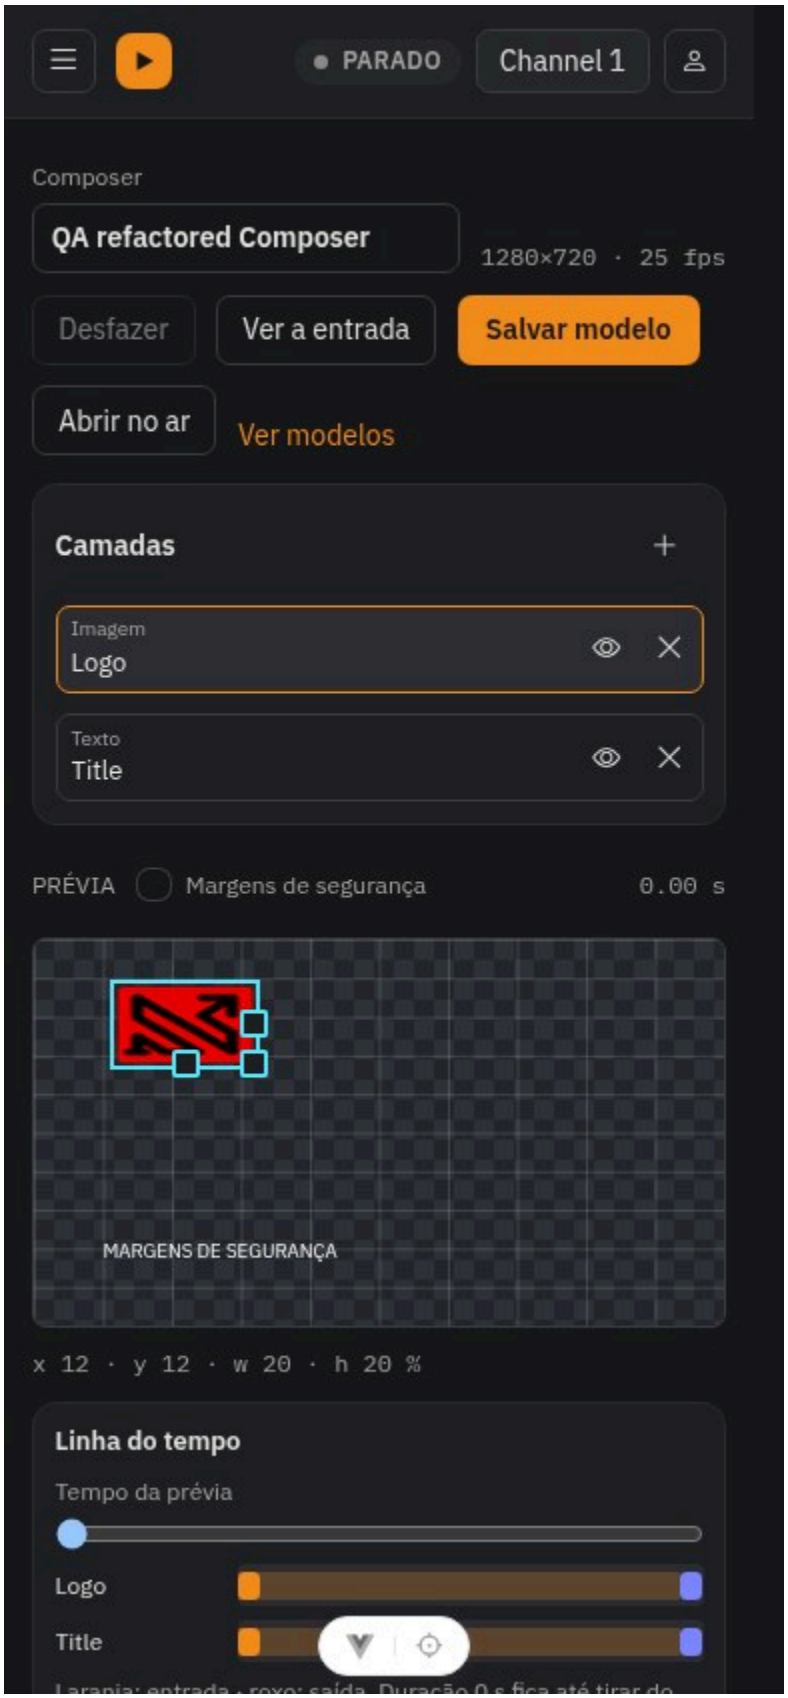

All fixtures are disposable and synthetic. Program shows actual advancing video. Editor checkerboards and guides are authoring aids. The initial parity attempt had a missing capture directory; its logs are retained and the clean repeat passed.

The isolated HLS run has zero channel ERROR entries and proves animated GIFs, scheduled text/window ownership, overlapping logo leases and fade. Physical desktop/device output, a long soak and remote CI execution are not claimed.

See graphics-maintenance.md for ownership, extension recipes and consulted official references; README.md links all metrics, health samples, logs and screenshot sources.
