NoAr — animated graphics and model schedules

Branch: claude/branch-review-opz967
Implementation: e80a27bf · 2026-11-07

- GIF playback with transparency, per-frame timing and bounded frame caches.
- First image insertion uses natural output geometry. Same-output artwork fills the canvas; replacements preserve authored layout.
- Scheduler chooses Composer models, previews, manual fields and source records. Existing legacy action events remain compatible.
- 714 Rust tests passed, 14 ignored. 33 clean-installation browser tests and four final affected regressions passed, plus manual pt-BR desktop/phone authoring.
- Actual HLS proves GIF changes, timed text/L-shape entry and exit, manual-take survival, overlapping disabled-logo schedules with fade, full-frame artwork and backend restart.
- 76 exact legacy HTTP responses and both XMLTV cases match released 2.2.1. The unchanged static-layout scenario matches all 1,000 raw and aligned HLS frames exactly.

All accounts, artwork and video are disposable synthetic fixtures. Gray Program is actual source video; blue/green Composer and Scheduler previews are authoring illustrations. Browser GIF preview has an independent phase.

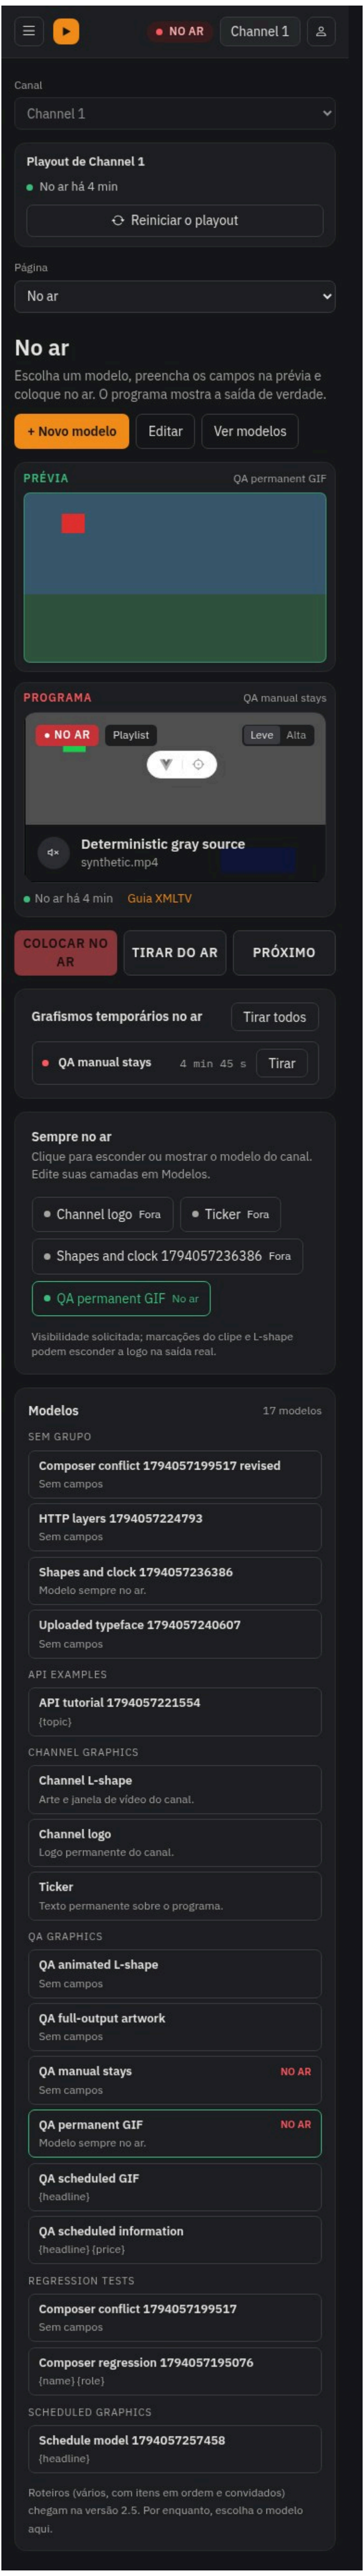

GIF limits: 10 MiB file, 256 frames, 60-second loop, 32 MiB decoded frames per image and 64 MiB per composition. Physical/desktop GIF output and a formal soak were not run.

The isolated HLS window has zero ERROR entries. An earlier pre-final clip-sync error under concurrent build/browser work is retained separately and is not classified as an environment limitation without a same-load baseline. See README.md and the JSON evidence.

Each following page preserves a full screenshot; all individual images are at most 1440 px wide.
